

# Illinois Traffic and Pedestrian Stop Study

2023 ANNUAL REPORT: PEDESTRIAN STOPS

## Part II Detailed Tables

Prepared for the Illinois Department of Transportation

By

The Mountain-Whisper-Light: Statistics & Data Science

In Cooperation with SC-B Consulting, Inc.

## **Acknowledgements**

The Mountain-Whisper-Light Statistics and SC-B Consulting, Inc. gratefully acknowledge the contributions of Jessica Keldermans (Bureau Chief) and Sean Berberet, Bureau of Data Collection, Illinois Department of Transportation, and their associates at IDOT. Ms. Keldermans and Mr. Berberet offered important support frequently throughout the study period. Many thanks to the office of the Illinois Secretary of State for providing summary statistics on drivers' licenses (without any personally identifying information). We are also grateful to the law enforcement agencies and their staff for their diligence and patience in collecting and processing the data used in this study.

## *Pedestrian Stops: Agency Tables*

The following section comprises tables summarizing 2023 Illinois pedestrian stop data.

A summary of Illinois statewide pedestrian stops appears first followed by 1) summaries for each agency in alphabetical order, 2) a table listing agencies that reported zero stops, and 3) a table listing non-compliant agencies. This year, no agencies reported incomplete data for 2023 pedestrian stops.

Each law enforcement agency that supplied 2023 stop records was provided an advance copy of their tables to review and provide feedback prior to the completion of this final report. The agencies were invited to comment on the tables and the following 13 agencies did provide comments on their pedestrian tables:

Downers Grove Police	Gurnee Police	Normal Police
Elmwood Police	Illinois State University Police	Rockton Police
Fairview Heights Police	Lake Forest Police	Sycamore Police
Glencoe Dept. Of Public Safety	Mount Carmel Police	Zion Police
Grayslake Police		

Each agency's comments appear in this document following their statistical tables. IDOT has redacted some text. Receiving the feedback was appreciated and the comments were studied in detail. A number of agencies expressed similar concern about various aspects of the overall methodology. All such comments were carefully reviewed, and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is.

Readers are urged to read *Part I* of this report, the *Executive Summary*, a separate document. *Part I* is a guide to the use of the tables and explains how all the numbers were derived. *Part I* also includes technical appendices, which may be of interest to those who seek a deeper understanding of the methodology.

Summary of Pedestrian Stops for 2023 - ILLINOIS STATEWIDE RESULTS						Benchmark: Territory-based*
	White	Black or African American	Hispanic or Latino	Asian	American Indian or Alaska Native	Native Hawaiian or Other Pacific Islander
<b>Panel: 1 Summary of Pedestrian Stops, Rates, and Rate Ratios with 95% Confidence Intervals. Total stops: 83,149. Total benchmark population: 10,530,093.</b>						
Stops (% of Total)	8,227 (9.9%)	53,351 (64%)	20,458 (25%)	874 (1.1%)	104 (0.1%)	135 (0.2%)

## Comments Provided by the Law Enforcement Agency - FAIRVIEW HEIGHTS POLICE

The Illinois Association of Chiefs of Police (ILACP) has been made aware of substantial concerns with the Racial Profiling Prevention data collection methods employed by a third-party consultant, [REDACTED], based out of Seattle, Washington. Given our commitment to transparency and fair and equitable policing, the ILACP understands the reasoning for maintaining the collection of racial profiling data. However, we are concerned that as things stand, there exists the incredible potential for misunderstanding and subsequent lack of confidence in the work our officers are doing. In short, the ILACP is not assured that the data, as currently presented, is an accurate reflection of what the study initially was designed to identify. In October 2019, the IDOT Racial Profiling Prevention and Oversight Board (RPPDOB) changed statistical analysis vendors, selecting [REDACTED], resulting in significant changes to methodologies that had been in place since 2004 when the collection of information relative to traffic stops and race began. In fact, the 15 years of consistent reports by [REDACTED] have become a reliable method for police chiefs and others to review and, in some cases, understand year-over-year trends and changes in traffic and pedestrian stops.

After conducting a detailed review of the work performed by [REDACTED], we believe both their assumptions and methodologies are highly subjective and potentially racially biased before the data even begins to be gathered. Frankly, it does not appear to be a good way of discerning the true scope of traffic stops. The last four years of reports prepared by [REDACTED] have included widely varying results, leaving police chiefs and many other informed readers to grow less confident in the work.

The ability to analyze traffic and pedestrian stop information relies on the concept of “benchmarking.” Benchmarking is commonly defined as “evaluating or checking something by comparison with a standard.” Without using a reliable benchmark, observers are left to guess what the data means. Every piece of data collected since 2004 has used a (benchmark) to compare traffic and pedestrian stops against. The 15 years of reports by the previous vendor seldom adjusted benchmark methodology, resulting in reports that could be understood and used to compare over time. The four reports generated by [REDACTED] since 2018 have used at least four different benchmark measures. In addition, [REDACTED] has elected to create reports based on each of the five individual minority races rather than one group, thereby increasing categories that are sensitive to methodological changes. The result of these widely varying studies includes several media reports that cite misleading statistics, which in turn results in other potentially false assumptions. Consistently using different methodologies and benchmarks diminishes the ability of police chiefs to be able to rely on the data to make decisions concerning the reduction of any potential racial bias while making traffic stops. The ILACP actively works to reduce any potential for racial bias in police departments and communities. Since 2018, we at the ILACP have strived to support and operationalize the “10 Shared Principles of Public Safety.” Two of these principles have more relevance to the traffic enforcement functions we take pride in and perform:

- All persons should be treated with dignity and respect. This is another foundational value.
- We reject discrimination toward any person that is based on race, ethnicity, religion, color, nationality, immigrant status, sexual orientation, gender, disability, or familial status. We work to ensure these principles, in partnership with the Illinois State Conference NAACP, are put into the daily work of officers throughout the state in an effort to ensure fair and equitable law enforcement.

More than 300 police departments have formally adopted the Principles in some way to make sure they guide and influence those providing public safety services. The following are several items of concern regarding the Racial Profiling Prevention data collection methods employed by [REDACTED]:

- [REDACTED] used several different benchmarks over the course of four years including:
  - Countywide ACS data (2019)
  - Mixed County data (2020)
  - Distance or Crash Based (2021 and 2022)

- To establish a “crash-based” benchmark, ██████ examined motor vehicle accident reports (SR1050) which are submitted annually by each police agency. ██████ then decided to use only the data from one of the drivers to create a benchmark, as opposed to both drivers. ██████ is currently only using “Driver #2” data and ignoring the data of “Driver #1.” By choosing to only use Driver #2 information, ██████ has eliminated the data from the “at-fault” driver. Additionally, by only accepting crash reports with two vehicles, ██████ has eliminated all data for a single-vehicle crash.
- ██████ stated they used the Bayesian Improved Surname Geocoding (BISG) technique to predict the race of the driver since the SR-1050 crash reports do not contain the race/ethnicity of the driver(s). ██████ cited the limitations at the end of their 2022 report on page 92, stating, “We understand that this analysis is limited in a few ways. Specifically, we realize that race is a complex concept, and many people may describe themselves as multiracial. We also realize that there are at least four different ways the race variable could be designated: The race reported by the officer, race probability (BISG), self-reported race, and the genetic group that the driver may belong to. These four ways to designate race may or may not yield the same response. However, our analysis is strictly limited to available data - officer-reported race and BISG race probability.” They went on to say, “After predicting race for each driver, we compared predictions to the races designated by the officers and noted whether they were the same. If the comparison did not match, we flagged it as a potential mismatch. Approximately 40,000 drivers’ races were mismatched. Most of these mismatches were excluded from analysis when we removed estimates with low probability of accuracy. Over 12,000 high-probability mismatches remained, when the race predictions were greater than 95% probability. We then further analyzed the rates of these high probability mismatches by agency.”
- Using BISG to predict race has been shown to lead to misclassifications. In their May 2023 article Misclassification and Bias in Predictions of Individual Ethnicity from Administrative Records, Dr. Lisa P. Argyle, Ph.D., and Dr. Michael Barber, Ph.D., Associate Professors, Department of Political Science, Brigham Young University state, “We show that a common method of predicting individuals’ race in administrative records, Bayesian Improved Surname Geocoding (BISG), produces misclassification errors that are strongly correlated with demographic and socioeconomic factors. In addition to the high error rates for some racial subgroups, the misclassification rates are correlated with the political and economic characteristics of a voter’s neighborhood. Racial and ethnic minorities who live in wealthy, highly educated, and politically active areas are most likely to be misclassified as white by BISG. Inferences about the relationship between sociodemographic factors and political outcomes, like voting, are likely to be biased in models using BISG to infer race.”
- Zip code demographics are cited by ██████ as possibly being less accurate for small localities that do not align well with zip code boundaries.
- Illinois driver’s licenses do not identify the person’s race. ██████ identified minorities without physically observing the person ticketed by using BISG. At the June 15, 2023, RPPDOB meeting, a board member even noted that “from a racial profiling lens, the perception of the officer at the time of the stop is the most crucial element” compared to a person’s actual identifying classification being corrected.
- Each municipality’s benchmark was selected differently, meaning neighboring agencies could have similar driving populations but different benchmarks.
- The crash-based benchmark data utilized in the analysis by the new vendor included compiled crash reports over a period of multiple years to estimate the driving population, however, it did not include crash reports from the year for the analysis. Depending on how many usable crash reports were obtained for an agency, the margin of error ranged from 2.5%-10%.
- The rate ratios were determined differently between distance-based and crash-based benchmarks within a single year. Using an example from a police agency with a crash-based benchmark:

██████████ Method  
 326 stops Black or African American  
 5,831 Benchmark % Black or African American  
 Stop Rate 0.056  
 Stop Rate Ratio vs White 4.6

██████████ Method  
 326 stops Black or African American  
 5,831 Benchmark % Black or African American

Stop Rate 0.056

Stop Rate Ratio vs White 1.55

Because [REDACTED] uses different assumptions, the information in their reports is not comparable to data collected before 2019. Additionally, the data varies significantly from one year to the next, while we believe the enforcement practices and the people subject to traffic stops and crashes did not appear to change significantly. This is something [REDACTED] attests to and confirms in the first few pages of the executive summaries, for example:

- Page 9 of the Execureports were obtained for an agency, the margin of error ranged from 2.5%-10%.
- The rate ratios were determined differently between distance-based and crash-based benchmarks within a single year.

Using an example from a police agency with a crash-based benchmark:

[REDACTED] Method

326 stops Black or African American

5,831 Benchmark % Black or African American

Stop Rate 0.056

Stop Rate Ratio vs White 4.6

[REDACTED] Method

326 stops Black or African American

5,831 Benchmark % Black or African American

Stop Rate 0.056

Stop Rate Ratio vs White 1.55

Because [REDACTED] uses different assumptions, the information in their reports is not comparable to data collected before 2019. Additionally, the data varies significantly from one year to the next, while we believe the enforcement practices and the people subject to traffic stops and crashes did not appear to change significantly. This is something [REDACTED] attests to and confirms in the first few pages of the executive summaries, for example:

- Page 9 of the Executive Summary Traffic Stop Data Part 1
  - Page 11 of the Executive Summary 2020 Traffic Stops Part 1
  - Pages 10-11 of the II 2021 Traffic Stop Study Executive Summary Part 1
  - Page 9-10 of the 2022 Final Part 1 Executive Summary Traffic Using data from a law enforcement agency from the reports dated 2004-2018, the ratio of minority to non-minority stops is relatively consistent. The report varied from 0.69 to 1.00, with an average of 0.86. This resulted in a spread of 0.14 from the average to the lowest or highest Summary Traffic Stop Data Part 1
  - Page 11 of the Executive Summary 2020 Traffic Stops Part 1
  - Pages 10-11 of the II 2021 Traffic Stop Study Executive Summary Part 1
  - Page 9-10 of the 2022 Final Part 1 Executive Summary Traffic Using data from a law enforcement agency from the reports dated 2004-2018, the ratio of minority to non-minority stops is relatively consistent. The report varied from 0.69 to 1.00, with an average of 0.86. This resulted in a spread of 0.14 from the average to the lowest or highest data over the period. [REDACTED]
- [REDACTED] Executive Summary states, "For all calculations, we assumed the benchmark accurately captured the population of drivers or pedestrians. The benchmark used to calculate each rate is itself an estimate of the population of drivers or pedestrians for a racial group. Confidence intervals of rates and rate ratios assumed only sampling error and thus

do not account for this additional source of error in benchmark estimates. Accounting for benchmark error would increase the width of the confidence intervals reported for rates and rate ratios and would likely reduce the number of agencies that appear to stand out as needing further inquiry.”

The police chiefs and police departments believe equal enforcement of the law is critical to continue maintaining the public trust and discharging our responsibilities. To achieve these goals, we have enhanced our training to include implicit bias training. Additionally, the Illinois Association of Chiefs of Police co-developed the Ten Shared Principles regarding the relationship between law enforcement and the communities and people they serve.

Unfortunately, the last four years of IDOT RPDOB reports do not reflect the same level of professional standards and consistency in preparation as had been the standard for the prior 15 years. Because of these reports compiled by ██████, which we believe are deeply flawed, it is not possible to rely on these or inform readers regarding the reliable measures of traffic and pedestrian stops amongst minority and non-minority populations. We ask you not to draw any conclusions or suggest policy changes based on what appears to be seriously imprecise reports of the last four years. By their own admission, ██████ states in their reports, “the changes [in methodology] make it difficult to compare results from the 2020 stops analysis to the analyses in years prior to 2019.”

**Response**

Thank you for your comments. All comments and concerns were carefully reviewed and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is. IDOT has redacted some text.

**Comments Provided by the Law Enforcement Agency - Glencoe Dept. of Public Safety**

May 17, 2024

To Whom It May Concern,

In conjunction with the Illinois Association of Chiefs of Police, the below comments have been drafted regarding the way traffic and street stop data has been compiled on behalf of the State of Illinois. While reviewing the method of calculation, I am particularly alarmed that racial demographic information is simply assumed or guessed as this incorrect data will then be used to criticize law enforcement agencies with claims of racial bias. Not only is it ridiculous on its face, but the entire process is insulting. It is also ironic that if law enforcement agencies were to do the same, the public would call for their heads.

Members of the Glencoe Public Safety Department take particular care when ensuring their practices are constitutional, unbiased, and are defensible. By drawing data in this fashion, the entire process seeks to undermine those efforts and clearly paints agencies across the state with an unfair bias. That unfair bias, quite frankly, flies in the face of the original attempt at charting this demographic information.

The numbers generated in traffic stops and street stops is incredibly low in the village of Glencoe compared to other agencies. In consideration of this fact, the means of which this [REDACTED] organization tabulates racial demographic information is concerning--low overall numbers, combined with estimated additional inputs, would equate to radical manipulation of actual percentages. On its face, this should never be allowable based on this sole factor alone. Adding to this is the fact that data is introduced and provide without context: it is presumed that any officer involved in the stop is aware of the race of the driver. It does not take into consideration factors like tinted windows, major highways that pass-through municipalities, related calls for service, etc. Please see the below information provided collectively for your benefit.

The following are several items of concern regarding the Racial Profiling Prevention data collection methods employed by TMWL:

- [REDACTED] used several different benchmarks over the course of four years including:

- Countywide ACS data (2019)
- Mixed County data (2020)
- Distance or Crash Based (2021 and 2022)

- To establish a "crash-based" benchmark, [REDACTED] examined motor vehicle accident reports (SR-1050) which are submitted annually by each police agency. [REDACTED] then decided to use only the data from one of the drivers to create a benchmark, as opposed to both drivers. [REDACTED] is currently only using "Driver #2" data and ignoring the data of "Driver #1." By choosing to only use Driver #2 information, [REDACTED] has eliminated the data from the "at-fault" driver. Additionally, by only accepting crash reports with two vehicles, [REDACTED] has eliminated all data for a single-vehicle crash.

- [REDACTED] stated they used the Bayesian Improved Surname Geocoding (BISG) technique to predict the race of the driver since the SR-1050 crash reports do not contain the race/ethnicity of the driver(s). [REDACTED] cited the limitations at the end of their 2022 report on page 92, stating, "We understand that this analysis is limited in a few ways. Specifically, we realize that race is a complex concept, and many people may describe themselves as multiracial. We also realize that there are at least four different ways the race variable could be designated: The race reported by the officer, race probability (BISG), self-reported race, and the genetic group that the driver may belong to. These four ways to designate race may or may not yield the same response. However, our analysis is strictly limited to available data - officer-reported race and BISG race probability." They went on to say, "After predicting race for each driver, we compared predictions to the races designated by the officers and noted whether they were the same. If the comparison did not match, we flagged it as a potential mismatch. Approximately 40,000 drivers' races were mismatched. Most of these mismatches were excluded from analysis when we removed estimates with low probability of accuracy. Over 12,000 high-probability mismatches remained, when the race predictions were greater than 95% probability. We then further analyzed the rates of these high probability mismatches by agency."

• Using BISG to predict race has been shown to lead to misclassification. In their May 2023 article *Misclassification and Bias in Predictions of Individual Ethnicity from Administrative Records*, Dr. Lisa P. Argyle, Ph.D., and Dr. Michael Barber, Ph.D., Associate Professors, Department of Political Science, Brigham Young University state, “We show that a common method of predicting individuals’ race in administrative records, Bayesian Improved Surname Geocoding (BISG), produces misclassification errors that are strongly correlated with demographic and socioeconomic factors. In addition to the high error rates for some racial subgroups, the misclassification rates are correlated with the political and economic characteristics of a voter’s neighborhood. Racial and ethnic minorities who live in wealthy, highly educated, and politically active areas are most likely to be misclassified as white by BISG. Inferences about the relationship between sociodemographic factors and political outcomes, like voting, are likely to be biased in models using BISG to infer race.”

• Zip code demographics are cited by [REDACTED] as possibly being less accurate for small localities that do not align well with zip code boundaries.

• Illinois driver’s licenses do not identify the person’s race. [REDACTED] identified minorities without physically observing the person ticketed by using BISG. At the June 15, 2023, RPPDOB meeting, a board member even noted that “from a racial profiling lens, the perception of the officer at the time of the stop is the most crucial element” compared to a person’s actual identifying classification being corrected.

• Each municipality’s benchmark was selected differently, meaning neighboring agencies could have similar driving populations but different benchmarks.

• The crash-based benchmark data utilized in the analysis by the new vendor included compiled crash reports over a period of multiple years to estimate the driving population, however, it did not include crash reports from the year for the analysis. Depending on how many usable crash reports were obtained for an agency, the margin of error ranged from 2.5%-10%.

• The rate ratios were determined differently between distance-based and crash-based benchmarks within a single year. Using an example from a police agency with a crash-based benchmark:

[REDACTED] Method  
326 stops Black or African American  
5,831 Benchmark % Black or African American  
Stop Rate 0.056  
Stop Rate Ratio vs White 4.6

[REDACTED] Method  
326 stops Black or African American  
5,831 Benchmark % Black or African American  
Stop Rate 0.056  
Stop Rate Ratio vs White 1.55

Because [REDACTED] uses different assumptions, the information in their reports is not comparable to data collected before 2019. Additionally, the data varies significantly from one year to the next, while we believe the enforcement practices and the people subject to traffic stops and crashes did not appear to change significantly. This is something [REDACTED] attests to and confirms in the first few pages of the executive summaries, for example:

- Page 9 of the Executive Summary Traffic Stop Data Part 1
- Page 11 of the Executive Summary 2020 Traffic Stops Part 1
- Pages 10-11 of the II 2021 Traffic Stop Study Executive Summary Part 1
- Page 9-10 of the 2022 Final Part 1 Executive Summary Traffic

Using data from a law enforcement agency from the reports dated 2004-2018, the ratio of minority to non-minority stops is relatively consistent. The report varied from 0.69 to 1.00, with an average of 0.86. This resulted in a spread of 0.14 from the average to the lowest or highest data over a 15-year period.

Using data from the same law enforcement agency as above from 2019-2022, the ratio of minority to non-minority stops is inconsistent when it is calculated using [REDACTED] method. The report varied from 0.98 to 1.41, with an average of 1.19. This resulted in a spread of .22 from the average to the lowest or highest data over a 4-year period.

[REDACTED] Executive Summary states, "For all calculations, we assumed the benchmark accurately captured the population of drivers or pedestrians. The benchmark used to calculate each rate is itself an estimate of the population of drivers or pedestrians for a racial group. Confidence intervals of rates and rate ratios assumed only sampling error and thus do not account for this additional source of error in benchmark estimates. Accounting for benchmark error would increase the width of the confidence intervals reported for rates and rate ratios and would likely reduce the number of agencies that appear to stand out as needing further inquiry."

The police chiefs and police departments believe equal enforcement of the law is critical to continue maintaining the public trust and discharging our responsibilities. To achieve these goals, we have enhanced our training to include implicit bias training. Additionally, the Illinois Association of Chiefs of Police co-developed the Ten Shared Principles regarding the relationship between law enforcement and the communities and people they serve.

Unfortunately, the last four years of IDOT RPDOB reports do not reflect the same level of professional standards and consistency in preparation as had been the standard for the prior 15 years. Because of these reports compiled by [REDACTED] which we believe are deeply flawed, it is not possible to rely on these or inform readers regarding the reliable measures of traffic and pedestrian stops amongst minority and non-minority populations.

We ask you not to draw any conclusions or suggest policy changes based on what appears to be seriously imprecise reports of the last four years. By their own admission, [REDACTED] states in their reports, "the changes [in methodology] make it difficult to compare results from the 2020 stops analysis to the analyses in years prior to 2019."

We urge you to post a disclaimer detailing, what [REDACTED] readily admits in their reports, that these reports cannot be compared from year to year, and the 2019-2023 reports should not be compared to those prior. We further suggest a summary statement of the ILACP's concerns brought forth in this letter be prominently displayed on the IDOT website.

Considering the above factors, we would strongly recommend that a different vendor who understands the importance of collecting and analyzing data consistently over time be selected to prepare future reports.

Additionally, we respectfully ask that you incorporate input from the police agencies whose data is analyzed to provide input on variables they may be aware of that could impact the data analysis. In conclusion, it is strongly recommended that the state no longer utilize [REDACTED] in this process short of these additional recommendations. They are not truly representing accurate data, not delivering it in an unbiased digestible method, and not providing a product that the State of Illinois demands on behalf of its residents. The lack of context, coupled with errors in assumed names based solely on geographic assumptions, is dangerous junk science.

Yours truly,

Sean R. Loughran  
Director of Public Safety  
Glencoe Public Safety Department

## Response

Thank you for your comments. All comments and concerns were carefully reviewed and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is. IDOT redacted some text.

**Comments Provided by the Law Enforcement Agency - GURNEE POLICE**

This out-of-state vendor has elected to use our community's estimated driving age population as a benchmark for field interview analysis. The Village of Gurnee has a population of 30,000, yet welcomes over 23 million visitors a year to Six Flags Great America, Gurnee Mills Mall, Great Wolf Lodge Resorts as well as numerous other hotels, entertainment and retail locations. This leads to an inaccurate comparison for demographics.

**Comments Provided by the Law Enforcement Agency - ILLINOIS STATE UNIVERSITY POLICE**

During our review of Pedestrian Stops, we found uploaded IDOT data was not counting each stop individually. Some stops that have the same data points (i.e., on the same date, time, and the individuals are the same race) are only being counted once even if there were four entries, because the IDOT system counts them as duplicate entries. Without names or unique identifiers required for the stops, this will continue to be an error. We have reported this error to IDOT. Until this is error is corrected, this data is not entirely accurate.

**Comments Provided by the Law Enforcement Agency - LAKE FOREST POLICE**

The Lake Forest Police Department is deeply concerned with the methodologies and practices used by [REDACTED]. Over the last three years, [REDACTED] has altered the way they have calculated benchmarks for our agency. Those benchmarks have changed between county population, distance-based, and crash-based. For 2023, [REDACTED] used a crash-based benchmarking methodology that relies only on two-vehicle accidents, of which they only analyze the Unit 2 driver. Furthermore, [REDACTED] uses an unscientific method of assumptions about a person's racial makeup based on their zip code and last name. [REDACTED] authors make several disclaimers to the accuracy of their study.

Based on the varied benchmark methodologies and vast differences in results, the Lake Forest Police Department cannot rely on this data.

**Response**

Thank you for your comments. All comments and concerns were carefully reviewed and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is. IDOT has redacted some text.

**Comments Provided by the Law Enforcement Agency - NORMAL POLICE**

It continues to be the position of the Normal Police Department that the analysis presented by IDOT does not provide an adequate benchmark of the actual driving population in this community. The mix of large employers in the private sector, multiple Universities and Colleges along with the convergence of Interstates 74, 55 and 39 create a unique transient driving population that is not represented in the benchmark population assigned to our agency. The driving population and resident population are not equal, and statistical studies like this which largely ignore the fact that commuting motorists make up a large portion of the driving population present an inaccurate representation of traffic stop activity in the area.

Analysis of the resident data on traffic stops submitted to IDOT continues to show a large percentage of stops involved drivers with a resident zip code outside the immediate communities of our benchmark population, which illustrates the number of drivers on our roadways which are not part of our resident population.

This department continues to dispute the methods used for establishing benchmark driving population and contends that traditional methods used to determine benchmark resident population are inadequate to accurately reflect benchmarks for motorists within modern, highly mobile and transient driving populations. Additionally, we believe that the data utilized to determine the benchmark driving population was insufficient (sample size of 1,046 crashes examined for a population of 156,471) and non-representative of the driving population (recording only non at fault driver in 2 vehicle crashes – which would be the driver more likely to be familiar with the area and less likely to be from outside the area). The guide provided by the study team outlines various other limitations for the accuracy of the data which we will not reiterate here, but feel that it is important to note that the ratios presented by this study are based on benchmark populations that do not capture the actual motoring public in this area.

The Normal Police Department remains committed to protecting the citizens in our community, those living and working here along with those drawn to the area to enjoy the multitude of recreational activities offered. The Department remains committed to the use of sound police strategies based on probable cause and the judicious use of police discretion.

**Response**

Thank you for your comments. All comments and concerns were carefully reviewed and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is.

**Comments Provided by the Law Enforcement Agency - ZION POLICE**

The Zion Police Department is unable to rely on the data presented in this study for its own internal training and quality control. The varied and inconsistent methodologies employed since 2019 by this vendor, have led to widely ranging benchmarks, and the corresponding data is inconsistent with both our agency's lived experience and oversight of individual officer activities. This is a significant departure from the fifteen-years of previous reports that employed consistent methodology, year over year.

The report's authors include several disclaimers to the accuracy of their study. At the same time, they have elected to further complicate the study and constantly change methodologies making any use of the data unreliable. Below is a sample of the disclaimers the authors include:

There is a limitation in the use of ratios in determining if there are potential racial disparities. The 95% confidence intervals for stop rates and stop rate ratios do not take into account any error in estimating the driver and pedestrian populations that might be stopped. (These populations are referred to as "benchmarks.")

The problem is as follows. The benchmarks attempt to estimate the actual driving or pedestrian population within the jurisdiction of each agency using a combination of data sources, including surveys by the U.S. Census Bureau, Illinois crash reports, and Illinois driver license counts. But these data can only approximate the driving and pedestrian populations and necessarily rely on particular assumptions which may not always be accurate. See Appendix A in this document for more information on the benchmark methodologies and benchmark limitations.

Thus, the benchmarks used for stop rates may have some error.

**Response**

Thank you for your comments. All comments and concerns were carefully reviewed and a response will be posted online by IDOT. Readers and users of the reports on 2023 stops can be assured that the rates, ratios, percentages, benchmarks and other statistics are valid and can be used as is.
