To whom it may concern,

I am writing this email to voice my opposition in the Covid-19 vaccination matter and to share some info that is not being publicly shared with everyone.

If we take a minute to consider how Covid-19 non-vaccine "biological therapy" is purported to work, it makes perfect sense that it will cause a "surge" in "cases." The injection sends lipid nanoparticles containing mRNA into cells. There the mRNA is translated to produce nucleic acid sequences for the spike protein of SARS-CoV-2. Once that protein is generated and released, the person's immune system will then recognize the spike protein as foreign and it will begin to make antibodies to seek and destroy the spike proteins and the virus that may or may not be attached to it. Or that's the way it is supposed to work. But there are severe side effects that are associated with this shot including but not limiting immune enhancement. One type of immune enhancement is known as Antibody Dependent Enhancement (ADE). This is a process where a virus leverages antibodies to aid infection. In short, the antiCOVID antibodies, stimulated by a vaccine, amplify the infection rather than prevent its damage. This paradoxical reaction has been seen repeatedly in other vaccines and animal development trials especially with coronavirus vaccine trials. Other known complications of vaccines include neurological diseases such as transverse myelitis, Bells' Palsy multiple sclerosis, autism, and Guillain-Barre.

Trial studies also haven't shown whether the Covid-19 vaccine can prevent transmission of the SARS-CoV-2 virus.

Furthermore, COVID tests are designed to detect the SARS-CoV-2 spike protein. If the COVID shot is designed to instruct the body to begin producing SARS-CoV-2 spike protein the person who got the COVID shot will start testing positive for SARS-CoV-2 spike protein. So the shot that is supposed to initiate an immune response to COVID will also be producing the spike protein that causes a positive COVID test.

Covid-19 vaccine is an experimental drug and vast majority of people do not get very sick with Covid (mild symptoms) and there are many alternative treatments.

Based on the aforementioned please consider making this vaccine voluntary.

Thank you,  
-Marta Melkowska
